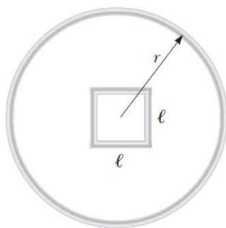
Physics for Engineers
Tutorial - Chapter 31

Question 1

A square, single-turn wire loop l = 1.00 cm on a side is placed inside a solenoid that has a circular cross section of radius r = 3.00 cm as shown in the end view of Figure. The solenoid is 20.0 cm long and wound with 100 turns of wire. (a) If the current in the solenoid is 3.00 A, what is the magnetic flux through the square loop? (b) If the current in the solenoid is reduced to zero in 3.00 s, what is the magnitude of the average induced emf in the square loop?



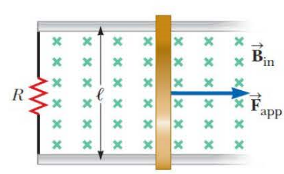
Question 2

A coil formed by wrapping 50 turns of wire in the shape of a square is positioned in a magnetic field so that the normal to the plane of the coil makes an angle of 30.0º with the direction of the field. When the magnetic field is increased uniformly from 200 µT to 600 µT in 0.400 s, an emf of magnitude 80.0 mV is induced in the coil. What is the total length of the wire in the coil?

Question 3

(a) Consider the arrangement shown in Figure. Assume that R = 6.00 Ω, l = 1.20 m, and a uniform 2.50-T magnetic field is directed into the page. At what speed should the bar be moved to produce a current of 0.500 A in the resistor?

(b) The resistor is R = 6.00 Ω, and a 2.50-T magnetic field is directed perpendicularly downward, into the paper. Let l = 1.20 m. (i) Calculate the applied force required to move the bar to the right at a constant speed of 2.00 m/s. (ii) At what rate is energy delivered to the resistor?



Question 4

A conducting rod of length l moves on two horizontal, frictionless rails as shown in Figure of Question 6. If a constant force of 1.00 N moves the bar at 2.00 m/s through a magnetic field $\vec{\mathbf{B}}$ that is directed into the page, (a) what is the current through the 8.00-Ω resistor R? (b) What is the rate at which energy is delivered to the resistor?
